IF WINDOWS DOES NOT AUTOMATICALLY RUN THE CD

If Windows does not recognize the CD-ROM and does not launch the setup program, follow these steps to locate you the exe file.

**STEP 1:**
Open your Windows start menu and click ‘computer’. (my computer on Windows XP).

**STEP 2:**
Browse computer and click on ‘Media Vault’.

**STEP 3:**
Browse the disc and open “MediaVault.exe” that is in the root directory of the CD-ROM. This will launch the executable that will allow you to properly install the application.
INSTALLATION INSTRUCTIONS

Insert the Media Vault installation disc into your CD/DVD/Blu-ray optical drive.

Windows should automatically detect the CD and launch the installation menu.

**STEP 1:**
Click on ‘Run MediaVault.exe’ from the AutoPlay window displayed to start the installation process.

**STEP 2:**
The Media Vault Setup will launch, click ‘Next’ to continue.
STEP 4:  
Read terms and check ‘I accept the terms of the license agreement’ and click ‘Next’.

STEP 9:  
The installation is complete. Click ‘Finish’ to start using Media Vault.

USING 123 MEDIA VAULT

123 Media Vault is a great solution for keeping personal videos saved on your PC locked to others. Once a video is locked, it appears only inside 123 Media Vault, and can only be played from there. You can easily unlock and delete videos too. 123 Media Vault is designed to be convenient and fast, as well as secure.

All locked Videos are accessed by a Master password. Once you enter the correct password, you'll see your videos. If you forget your password, you cannot access the video files. You need to enter your master password each time you use 123 Media Vault.
HOW TO LOCK A FILE
Locking files is easy. You can do it in two ways:
Drag and drop files into Video 123 Media Vault.
- or -
Click the Lock button, and pick the files to encrypt.

Once a file is locked, the original file is removed, and the locked file appears in the list of files in 123 Media Vault.

HOW TO PLAY LOCKED FILES
To play a locked file, select it from the list, and click the Play button. When you're done playing the file, and you close 123 Media Vault, the file becomes locked again.

HOW TO UNLOCK A FILE
If you want to unlock a locked file, select it from the list and click the Unlock button. The file is restored to it's original location, with the same name it had before. The file is removed from the list of files.

HOW TO DELETE A FILE
To delete a locked file, select the file and click the Delete button. The file is permanently removed from your PC. There is no way to recover the file once it is deleted.
In the 123 Media Vault Settings dialog, you can do the following:

- **Set Encryption Method:** (Fast Encryption or Full Encryption). Fast Encryption just encrypts the first 20 Kb of the file, which makes it unplayable, but does leave some of the media data intact. This is less secure, but offers very fast playback, even for super-large files. Full Encryption encrypts the entire contents of the file, which is fully secure, but may cause a delay when playing back a file. If you change the encryption method, existing files are still encrypted with the method in effect at the time they were encrypted.

- **Change Password:** Re-encrypt your video files with a new password.

- **Open log file folder:** For any support issues, you may be asked to attach the log file 123 Media Vault creates. This is an easy way to locate the file.
